

The book 'Science for Genetic Engineering' and its importance

Given the need and importance of the 2012 book Science for Genetic Engineering, the second version is coming in 2021. This version is a modified form of the first version which is more intuitive and clearer. At the same time, every effort has been made to make it faultless, so that readers can easily understand it.

This is an important book based on science fiction that says that we human beings should not be superstitious. Keep your eyes and ears, nose as well as your mind open and rely on things that are logical and natural. Through this, he made Darwin's 250-year-old theory that monkeys and chimpanzees have developed humans, he has refuted this hypothesis and, based on various arguments and references, has propounded the 'Self-Originist Theory E-7', under which he claims human beings, like other animals, developed when they became self-friendly. Animals don't make humans from monkeys!

However, some others, like me, would agree with the author's view that if it had really been possible to become a human being from a monkey, why could a monkey not become a human being even today, why not speak? That is, the author has tried to logically put an end to the irrational things that have been said for years about human development in the name of science; so that at least our children and the younger generation learn the right thing. Due to this scientific thinking, the importance of this book can also be gauged from the news that its research has also been included in Indian General Research, and it has also been recognized by the Biotechnology Department of the Government of India.

This important book has been written by Dr. Prabhakar Govind Rao Chavare and edited in the most beautiful way by writer and journalist Ramanuj Sundaram. The more publicity this book gets, the better it is for human society that when a man is born, he is a child, but even when he grows up because of wrong learning, he is not able to grow up thinking because he does not get such a book and a set of sanskar/society. I hope a large section of the society will be able to read this book and start looking at the society in a logical way. Many congratulations and best wishes to the author for this enlightening book focused on scientific thinking!
